

AgentID

What we are building

AgentID gives an AI agent what it needs to act in the real world: a phone number, an email address, a payment card, and a calendar. One API call sets all of it up. Every action the agent takes (a call, an email, a payment) runs through us, so there is a record of what it did and a limit on what it is allowed to do. It is a building block like Stripe or Twilio, except it is a single layer that covers all of those at once, with the guardrails built in.

The quick version

We sell to people building AI agents that need to do real things, not just chat. They pay a monthly fee per agent plus usage, the same way Twilio bills for calls and texts. They find us through a free tier and upgrade when they outgrow it, so we do not need a sales team to start. And once an agent's identity and its history of actions live with us, switching to something else is painful. That is what keeps customers.

Words you will hear, decoded

Business talk is full of shorthand. Here is the set you will actually run into.

Term	What it means
Market size (TAM / SAM / SOM)	How big the opportunity is. TAM is the whole pie, SAM the slice we could realistically serve, SOM what we actually capture in a few years.
ARPU	Average money one customer brings in per year.
ARR / MRR	Recurring revenue per year or per month. The subscription money a SaaS lives or dies by.
ICP	The kind of customer we fit best.
Wedge	The small first thing we sell to get in the door.
PLG (product-led growth)	The product sells itself through a free tier; people adopt it like an open source tool, no salesperson needed.
Churn	The share of customers who leave.
CAC / LTV	What it costs to win a customer versus what they are worth over time. We want the second far bigger than the first.
Moat	Whatever stops a competitor from simply copying us.
Take rate	The cut we keep on a transaction, like an app store commission.
Design partner	An early customer who builds with us and gives feedback, usually at a discount.

Who pays

Roughly four kinds of customers, from smallest wallet to biggest. Indie developers on side projects will mostly stay on the free tier. Startups building agent products are our first real

money: they will pay to ship faster instead of wiring everything themselves. Platforms that run whole fleets of agents, like NanoCorp and Polsia, write the biggest checks, because they have to manage and audit thousands of agents at once. Enterprises come last: slow to buy, but large when they do, and they care most about security and a clean audit trail.

How we charge

The base is a monthly fee per active agent, plus usage on top (call minutes, texts, emails) with a margin. Again, the Twilio model. One thing worth saying out loud: we do not charge per user seat. A normal SaaS charges per human; here the agent is the user, so the agent is the unit we bill. Big customers get custom enterprise deals for governance, audit and support. Card payments can become a margin source later, but only once we are set up as a card issuer, which involves real regulation. That is a phase two move, not day one.

Pricing

	Free	Pro	Enterprise
Price	0	~\$49/mo + usage	custom (\$50 to 250k/yr)
For whom	trying it out	agent startups	big companies / fleets
Unlocks	a few test agents	audit log + spending limits	custom policies, SSO, compliance

Each step up unlocks one or two things that justify paying more. Free and Pro have public prices; Enterprise is a conversation.

How we grow

Growth starts with the product, not a sales team (that is what PLG means). Someone tries the free tier, likes it, and upgrades. We lead with the one capability that makes people sit up in a demo, the agent placing a real phone call, and once they are in they add the rest: email, card, governance. We reach developers where they already are: Hacker News, X, Discord, the communities around agent frameworks, and the YC network.

Why we can win, and where we are thin

Two real advantages. First, the big players will not build the neutral layer that sits on top of all of them; Stripe and Twilio each own one piece and have no reason to make themselves replaceable. Second, once an agent's identity and audit history live with us, leaving means recreating everything and losing the trail. The honest part, which we should say plainly rather than dress up: right now our real edge is speed and a sharp angle (governance and audit), not an unbreakable moat. That is normal this early. The pitch should own it, not hide it.

The market, roughly

The market for AI agents is growing fast: analysts put it around \$50B by 2030, growing about 45% a year. Our specific layer is a smaller slice of that. Why now: agents can finally act, thanks to a wave of new standards that landed in 2025, but nobody has cleanly solved who an agent is and what it is allowed to do. That gap is the opening.

AI agents market is growing fast (~45%/yr)

Source: Grand View Research / MarketsandMarkets (2025-2030, projection). Our layer is a slice of this.

AI agents market, 2025 to 2030 (analyst projections).

How big is the slice we can actually get

Our reachable slice. SOM is the realistic 3 year target.

Who else is out there

Several startups each do one piece: AgentPhone does phone numbers, AgentMail does email, Keycard does identity. The giants (Stripe, Twilio, Visa) each own one primitive. Nobody yet bundles all of it with governance on top, which is our gap. Two of them, Composio and Keycard, are well funded and could move toward us, so speed matters.

Nobody owns integrated + governed (top-right)

Where players sit today. The top right (integrated and governed) is open.

What we still have to prove

The product alone will not win the pitch. Three things will:

1. One real customer who says, out loud, that they would pay.
2. A price someone actually agrees to, not a guess.
3. A convincing answer to 'why would I not just build this myself?', especially from the big platforms.

What the tech needs to show (so the business holds in the deck)

The business claims only land if the product backs them. For each claim, here is what the demo and the build have to show.

Business claim	What the tech has to show for it to be true
Set up in minutes, one API	The live demo runs a single provisioning call and the agent gets its phone, email and card on screen in under a minute.
Governance and audit are the moat	The audit log fills in real time, and a payment is blocked on screen because it crosses the spending limit.
We become the system of record	The agent identity, its permissions and its full history persist and stay visible after the demo, not reset each run.
Neutral, works across vendors	The provider underneath (voice or card) can be swapped without changing the agent or the API.
Billing per agent	Usage is metered per agent (calls, texts, emails, card spend), so the per agent price and the audit both rest on real numbers.

Improvements worth planning, beyond the demo:

- Scoped, short lived tokens per agent instead of long lived secrets (the 2026 standard for agent auth).
- An audit export (CSV or API) for the enterprise tier.
- A kill switch that revokes an agent instantly.
- A multi provider setup, so one provider changing its terms or going down does not break customers.
- A clean split between test mode and live mode for the card, so the demo is honest about what is simulated.

Two conditions to keep the story honest: payments stay partner powered until a card issuing program is in place (no real money moves in the demo), and at least one capability is genuinely live (the phone call) while the rest can be provisioned but simulated.

What goes on which slide

How this document feeds the pitch deck, without building the deck itself.

Deck slide	Comes from
Problem / Why now	The market section, plus the why-now line
Market	The two charts (market growth and TAM / SAM / SOM)
Competition	The 2x2 chart and the Who else is out there section
Business model	How we charge, plus the pricing table
Go-to-market	How we grow
Moat	Why we can win, and where we are thin
The ask	What we still have to prove

In one sentence: we sell companies building agents a real-world identity with controls, charge by subscription and usage, grow through the product itself, and stick around because we become the agent's system of record.
